

Penetrance density by residue

Missense variants · corrected BRCA2 polymer coverage · fixed variant-only leave-one-out scores

● 3D: experimental or local AF ▲ Polymer ■ Mixed contexts ---- Missense prior | No supported estimate

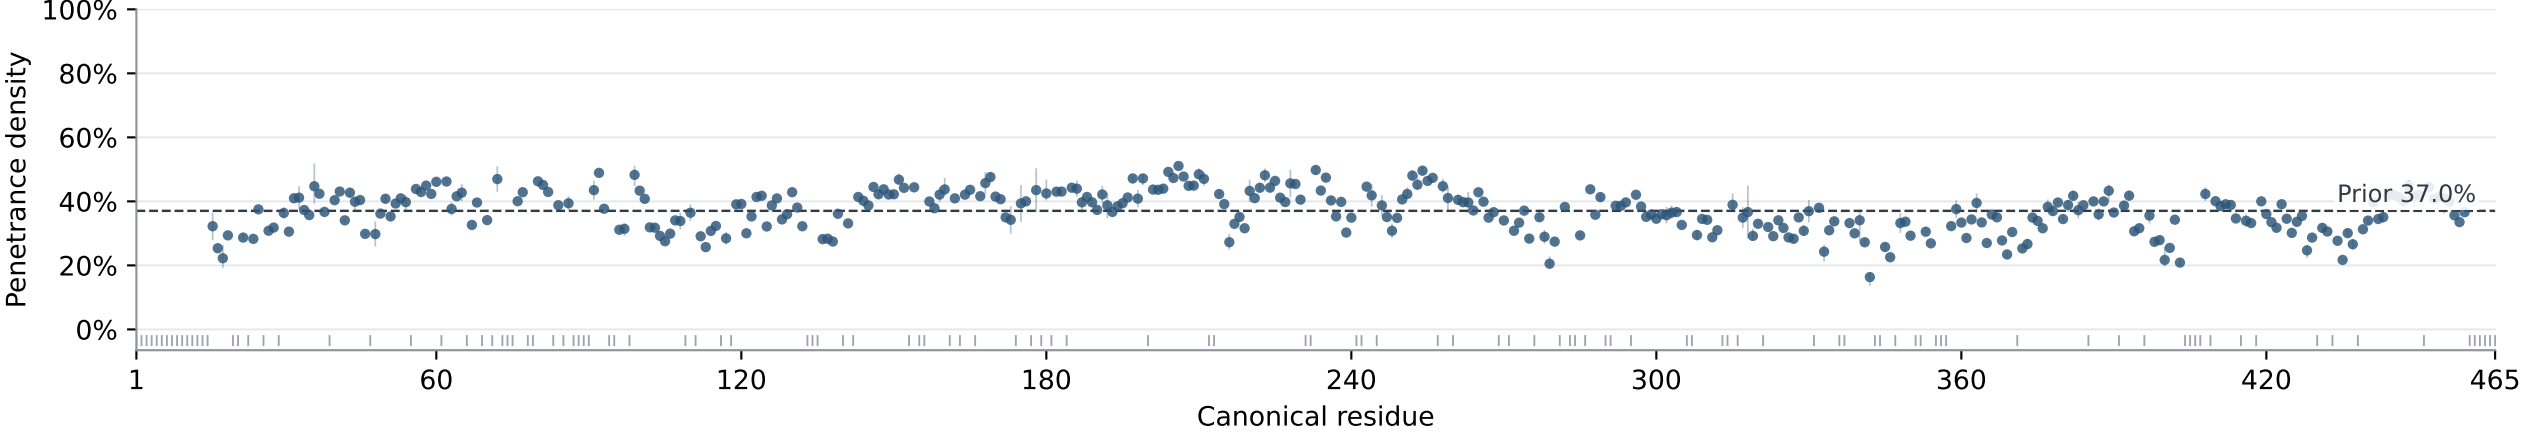

HNF1A · MODY3

427/631 residues · 726 variants

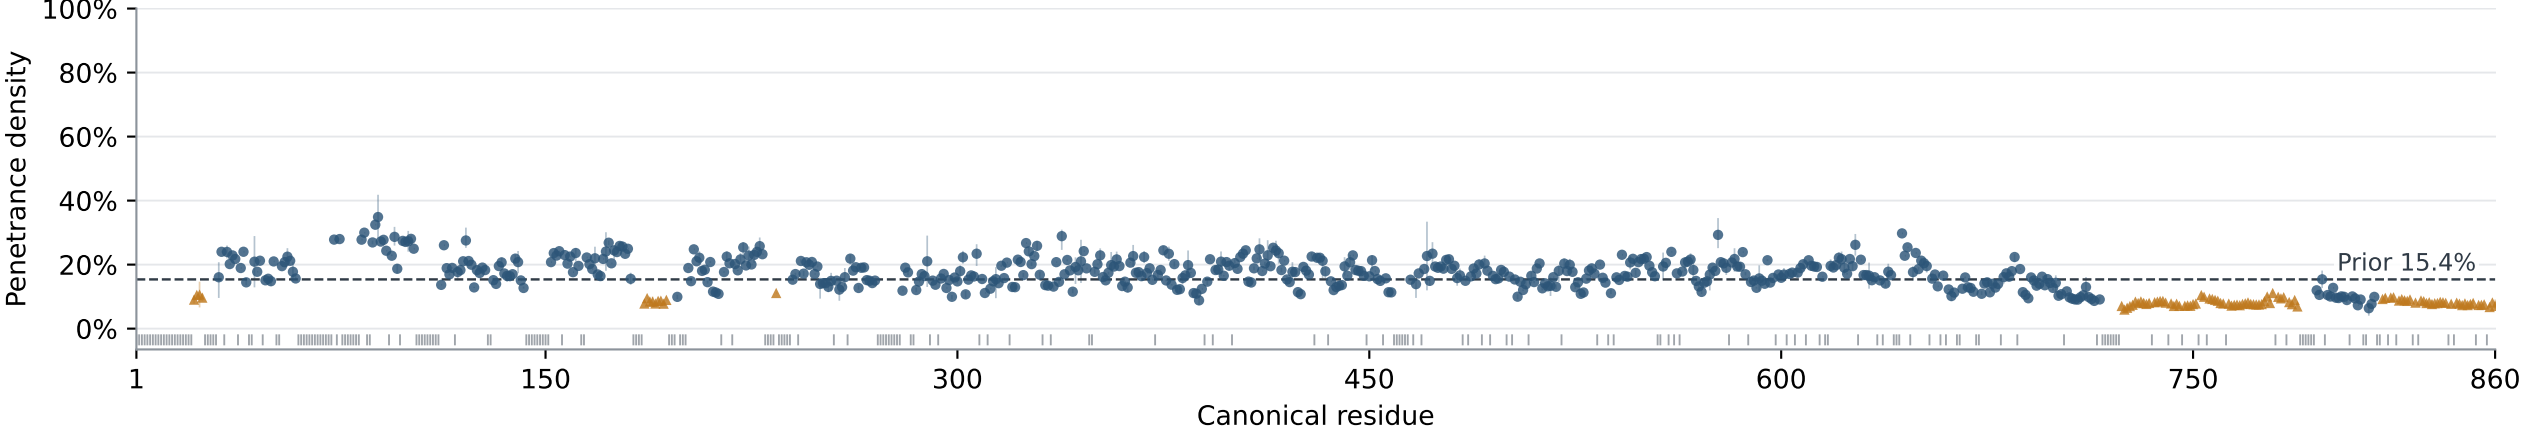

GCK · GCK-MODY (MODY2)

346/465 residues · 614 variants

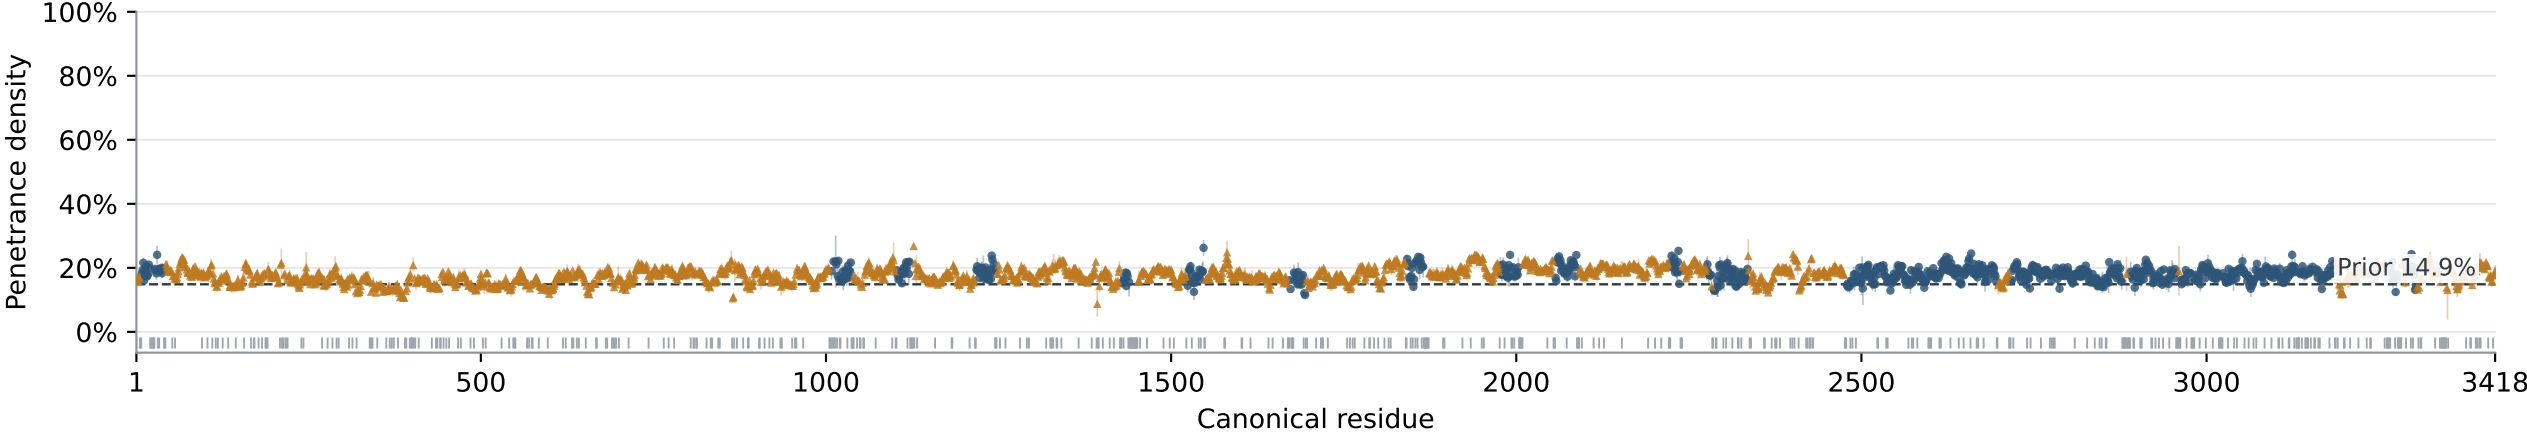

LDLR · Familial hypercholesterolemia

640/860 residues · 1,206 variants

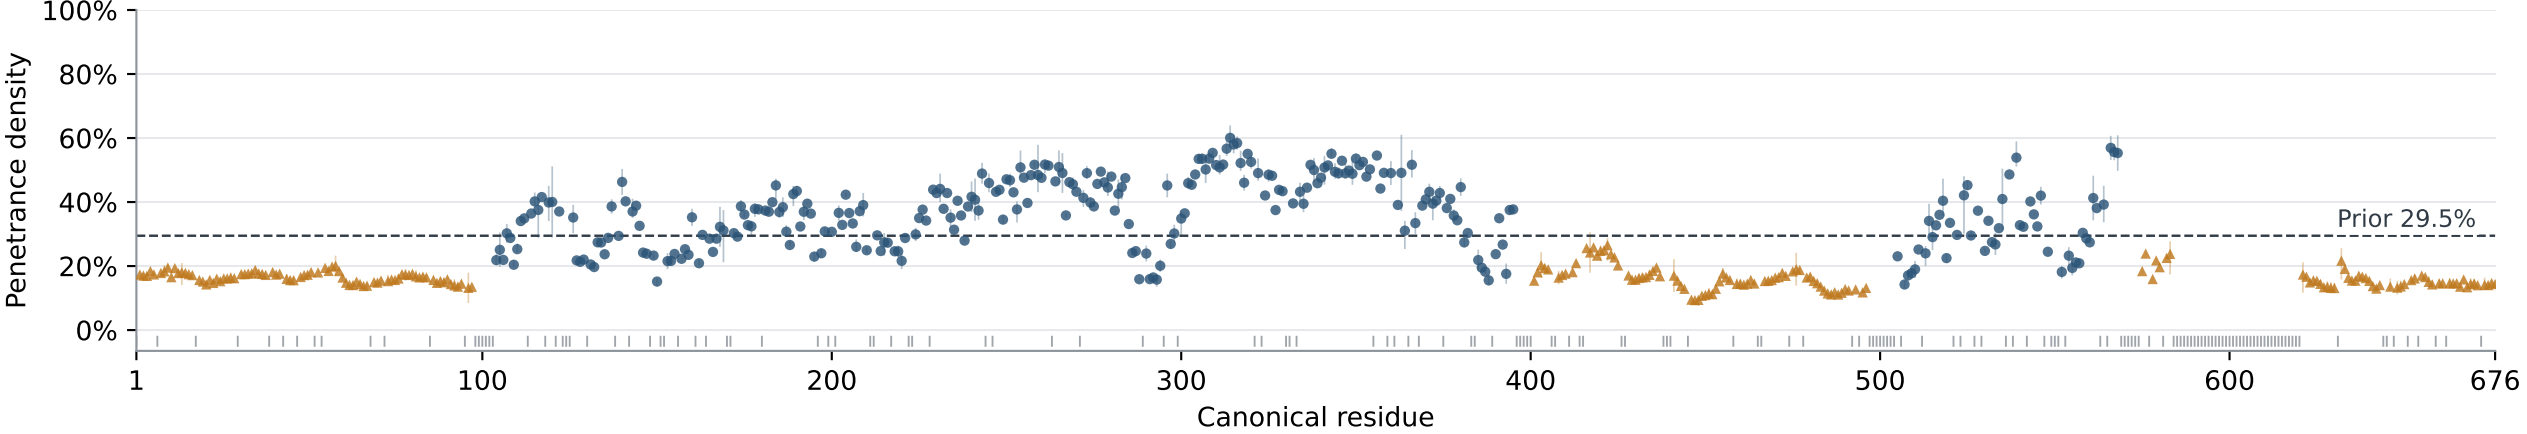

BRCA2 · Hereditary breast/ovarian cancer susceptibility

2,895/3,418 residues · 6,326 variants

KCNQ1 · Long QT syndrome type 1

508/676 residues · 975 variants

Dot = equal mean over supported variants at that residue. Thin span = between-variant range, not a confidence interval.

Disease names identify intended pairs; current clinical counts are pooled, particularly for GCK. gnomAD carriers are assumed unaffected.

These neighborhood features are not individual disease-risk estimates. Missing residues remain unestimated; no interpolation or extra smoothing.
