

Missense penetrance density by canonical residue

Posterior neighborhood · primary Observed-fraction neighborhood · diagnostic Gene/missense prior

Variant-only leave-one-out · $h=3 \text{ \AA}$ · gnomAD assumed unaffected. Track: blue 3D, gold polymer, purple mixed, grey unestimated. Means of supported variant scores; pale range is between variants, not a confidence interval. Lines break at unestimated residues. Source and endpoint corrections applied. These neighborhood features are not calibrated individual disease probabilities.
